semplice-linux project

Not the usual Debian remix, since 2009.

Debian is awesome: Everybody can modify, improve and remix it to fit their needs. It is a great base for a fast, lightweight, clean, and simple distribution. This is the aim of Semplice Linux, which is based on Debian sid to be always on the edge.

Designed to be lightning fast on modern 64-bit machines, it also works well on old glories, requiring only a 486 (or better) processor and 384
MB of RAM. To provide this fast environment, the distribution is based on Openbox.

Semplice doesn't harm any Debian iso – everything is built from scratch, based on official debian tools and official archives. The process is
automatic and ensures to have the same working environment across all builds. We try to compile according to the Debian Policy and everything
modified by us is available in our repositories. In fact, it's possible to get the same Semplice system simply starting from a basic debian boosttrap.

Although we strongly believe in open source, we do include non-free firmware in the standard distribution, to support a wide variety ofmachines. To encourage you to live without non-free software, we make it easy to remove them. See http://semplice-linux.org/doku/semplice:nonfree#installed_system for more information

Semplice provides a base working system for everything a common user needs. You will find a word processor (Abiword), a spreadsheet (Gnumeric), a music player (Exaile) and a great web browser (Chromium). And of course, the Synaptic Package Manager which lets you install the 38,000 packages that Debian offers!
